

Operating Systems

Grado en Informática. Course 2019-2020

Assignment 1: File systems

PART 1

Add to the shell started in previous assignments the following commands

- crear** – creates a file or directory in the file system
- its complete syntax is
 crear [-d] name
 where
 - * **name** is the name of the file (or directory) to be created.
 - If **-d** is specified a directory is to be created, otherwise an empty file will be created. If no name is given, the contents of the current working directory will be listed (nor recursively neither long listing)
 - Example:
 ->crear fich.txt
 ->crear -d carpeta
 ->crear -d /root/folder
 cannot create /root/folder: permission denied
- borrar** – deletes a file or a directory
- its complete syntax is
 borrar [-r] name
 - if **-r** is given and *name* is a directory, it will try to delete the directory and **ALL OF ITS CONTENTS**. If **-r** is not given, a directory **will only be deleted if its empty**. **-r** with a file has no special effect, it just deletes the file
 - if no *name* is given, the contents of the current working directory will be listed (nor recursively neither long listing)
 - When a file or directory cannot be removed, an appropriate message must be sent to the user

- info** – gives info on the files and/or directories supplied as its arguments
 – its complete syntax is

```
info name1 name2 name3 ....
```

where

- * **name1 name2 name3 ...** are the names of the files (or directories) to give info for.
- * it will produce **ONE LINE** of output for each item info is given on, in the same format as `ls -li` (resolving, if necessary, symbolic links). It is equivalent to `ls -li` for files and `ls -lid` for directories. **IT DOES NOT LIST THE CONTENTS OF A DIRECTORY**, just the directory itself.

– Example:

```
-> info enlace p1.c /home/antonio fjhsfkfhsdkf
15888887 -rw-r--r--  1 antonio antonio    4 Sep 15 13:35 enlace -> fich
15888887 -rw-r--r--  1 antonio antonio  2713 Sep 10 11:40 p1.c
15859713 drwxrwxrwx 156 antonio antonio 12288 Sep 20 12:13 /home/antonio/
cannot access fjhsfkfhsdkf: No such file or directory
```

- listar** – lists the directories and/or files supplied to it as command line arguments

– its complete syntax is

```
listar [-l] [-v] [-r] name1 name2 name3 ....
```

where

- * **-l** stands for long listing: if present, items will be listed **exactly** as the *info* command does. Otherwise only the name and size of each file and/or directory will be listed
- * For directories **ITS CONTENTS WILL ALSO BE LISTED**. If **-r** is given, directories will be listed recursively
- * All files or directories will be listed, including those whose name starts with `..`. To avoid listing hidden elements (those whose names starts with `“.”`), **-v** must be given
- * To check what type of filesystem object a name is, one of the *stat* system calls must be used. **DO NOT USE THE FIELD d_type** of the directory entry.

- * If no names are given, the current working directory will be listed.

PART 2

- Create two standalone programs `info.c` and `listar.c` that will do the same things as the *query* and *list* shell commands. Example:

```
$ listar -r -v /home/usuario /var/mail
```
- Make these programs capable of dealing with wildcard characters (*,?, ...)

Information on the system calls and library functions needed to code these programs is available through man: (*open, opendir, readdir, stat, lstat, unlink, rmdir, realpath, readlink ...*).

IMPORTANT:

- These programs should compile cleanly (produce no warnings even when compiling with `gcc -Wall`)
- **NO RUNTIME ERROR WILL BE ALLOWED** (segmentation, bus error ...). Programs with runtime errors will yield no score.
- These programs can have no memory leaks
- When one program cannot perform its task (for whatever reason, for example, lack of privileges) it should inform the user (See *errors* section at *HEPFUL INFORMATION*)
- All input and output is done through the standard input and output

HELPFUL INFORMATION

The following functions (*ConvierteModo()*, *ComvierteModo2()* and *ConvierteModo3()*) convert the mode of one file (in a *mode_t* integer) to "rwxrwxrwx" form. Note that the three functions have different ways of allocating memory

```
char TipoFichero (mode_t m)
{
```

```

switch (m&S_IFMT) { /*and bit a bit con los bits de formato,0170000 */
    case S_IFSOCK: return 's'; /*socket */
    case S_IFLNK:  return 'l'; /*symbolic link*/
    case S_IFREG:  return '-'; /* fichero normal*/
    case S_IFBLK:  return 'b'; /*block device*/
    case S_IFDIR:  return 'd'; /*directorio */
    case S_IFCHR:  return 'c'; /*char device*/
    case S_IFIFO:  return 'p'; /*pipe*/
    default: return '?'; /*desconocido, no deberia aparecer*/
}
}

char * ConvierteModo (mode_t m, char *permisos)
{
    strcpy (permisos,"----- ");

    permisos[0]=TipoFichero(m);
    if (m&S_IRUSR) permisos[1]='r'; /*propietario*/
    if (m&S_IWUSR) permisos[2]='w';
    if (m&S_IXUSR) permisos[3]='x';
    if (m&S_IRGRP) permisos[4]='r'; /*grupo*/
    if (m&S_IWGRP) permisos[5]='w';
    if (m&S_IXGRP) permisos[6]='x';
    if (m&S_IROTH) permisos[7]='r'; /*resto*/
    if (m&S_IWOTH) permisos[8]='w';
    if (m&S_IXOTH) permisos[9]='x';
    if (m&S_ISUID) permisos[3]='s'; /*setuid, setgid y stickybit*/
    if (m&S_ISGID) permisos[6]='s';
    if (m&S_ISVTX) permisos[9]='t';
    return permisos;
}

char * ConvierteModo2 (mode_t m)
{
    static char permisos[12];
    strcpy (permisos,"----- ");

    permisos[0]=TipoFichero(m);

```

```

    if (m&S_IRUSR) permisos[1]='r'; /*propietario*/
    if (m&S_IWUSR) permisos[2]='w';
    if (m&S_IXUSR) permisos[3]='x';
    if (m&S_IRGRP) permisos[4]='r'; /*grupo*/
    if (m&S_IWGRP) permisos[5]='w';
    if (m&S_IXGRP) permisos[6]='x';
    if (m&S_IROTH) permisos[7]='r'; /*resto*/
    if (m&S_IWOTH) permisos[8]='w';
    if (m&S_IXOTH) permisos[9]='x';
    if (m&S_ISUID) permisos[3]='s'; /*setuid, setgid y stickybit*/
    if (m&S_ISGID) permisos[6]='s';
    if (m&S_ISVTX) permisos[9]='t';
    return (permisos);
}

```

```

char * ConvierteModo3 (mode_t m)
{
    char * permisos;
    permisos=(char *) malloc (12);
    strcpy (permisos,"----- ");

    permisos[0]=TipoFichero(m);
    if (m&S_IRUSR) permisos[1]='r'; /*propietario*/
    if (m&S_IWUSR) permisos[2]='w';
    if (m&S_IXUSR) permisos[3]='x';
    if (m&S_IRGRP) permisos[4]='r'; /*grupo*/
    if (m&S_IWGRP) permisos[5]='w';
    if (m&S_IXGRP) permisos[6]='x';
    if (m&S_IROTH) permisos[7]='r'; /*resto*/
    if (m&S_IWOTH) permisos[8]='w';
    if (m&S_IXOTH) permisos[9]='x';
    if (m&S_ISUID) permisos[3]='s'; /*setuid, setgid y stickybit*/
    if (m&S_ISGID) permisos[6]='s';
    if (m&S_ISVTX) permisos[9]='t';
    return (permisos);
}

```

Errors

When a system call cannot perform (for whatever reason) the task it was asked to do, it returns a special value (usually **-1**), and sets an external integer variable variable (**errno**) to an error code

The man page of the system call explains the reason why the system call produced such an error code.

A generic message explaining the error can be obtained with any of these methods:

- the *perror()* function prints that message to the standard error (the screen, if the standard error has not been redirected)
- the *strerror()* function returns the string with the error description if we supply it with the error code
- the external array of pointers, `extern char * sys_errlist[]`, contains the error descriptions indexed by error number so that `sys_errlist[errno]` has a description of the error associated with *errno*

WORK SUBMISSION

- Work must be done in pairs.
- The source code will be submitted to the subversion repository under a directory named **P1**
- The name of the main programs will be `shell.c`, `listar.c` and `info.c`. Programs must be able to be compiled with `gcc shell.c`, `gcc list.c` and `gcc query.c` Optionally a `Makefile` can be supplied so that all of the programs can be compiled with just `make`
- **ONLY ONE OF THE MEMBERS OF THE GROUP** will submit the source code. The names and logins of all the members of the group should be in the source code of the main programs (at the top of the file)
- Works submitted not conforming to these rules will be disregarded.

DEADLINE: 23:00, FRIDAY OCTOBER 25TH, 2019

ASSESSMENT: FOR EACH PAIR, IT WILL BE DONE IN ITS CORRESPONDING GROUP, DURING THE LAB CLASSES
